

How is it that a current chart with the identical start date and distribution now shows no more than **190% at the peak, and zero gain for December? Where are the missing 60% (250-190) to January 4th**? The major refinement I made in July 2008 was to trade every substantial move, instead of trying to limit the trades to 1-2 per month. This market simply calls for more frequent trading for optimal results, and this adjustment has been a huge success.

The November high of **200%** on the top chart, shows as **190%** below. What's more, the *December performance has obviously been subtracted rather than added* and there is no trace of the post-split 25% earned in the first week of January. *Frankly I believe this is hacking*, accomplished by injecting malicious code into the Timertrac website. This Code corrupts the legitimate calculation of the tracked values, thus totally warping the tracked performance.

While the chart below shows the greatest amount of volatility since hacking began at the arrow, *nothing could be further from the truth*. While our signals are often early, we have gotten *every major turn right in this Market, especially since November*.

Strategy/Model Performance

TimerTrac has verified that the strategies below are actual.

December was tracked by Collective 2 at 63.9%, using the identical signals and ETFs with a bit more leverage. *(Since leverage magnifies errors, it proves we had a tremendous winning streak in December, reversing to long just as the market turned up)* If we conservatively back out that leverage, it translates into at least a 25-30% incremental gain in the *Pension Strategy*, rather than the “break even” demonstrated in Timertrac’s *graph above*. Next, if we attribute the entire 200%-340% spike entirely to the stock-split in red, the top graph still shows an *additional 25% accruing in the first week of January (365%-340%)*. Again it’s conspicuously missing in the lower chart. *Thus our performance for 2008 can be conservatively estimated to exceed 225% for the Pension strategy*. What’s more, the results to 1/9/09 should be 250% (225+25). *In two months time, more than half our performance record has been virtually stolen.*

Given that performance is a testament to the value of our analysis, it would seem that shutting us out is like shooting oneself in the foot. Why have we been excluded for two months? simply because of the explanation and graphs above. While some of the other timers on that Broadcast, tell a good story, when it comes to performance, the top five in aggregate don't add up to ours. Prove it to yourself! *If you are looking for entertainment investing nothing beats exceptional profits*. With these profits you can buy more of whatever pleases and entertains you for the long run.
